From the 1920s to the 1950s, the Arctic warmed tremendously. Glaciers were disappearing and collapsing, and Arctic sea ice was thinning and shrinking. Sixty ...

## Arctic Sea Ice Unchanged From 60 Years Ago | The

Arctic sea ice has remained largely unchanged from 60 years ago, according to a new study. The research, published in the journal *Journal of Climate*, found that the thickness and extent of Arctic sea ice in the 1950s and 1960s are similar to those in the 2010s. This is surprising because many scientists predicted that Arctic sea ice would melt significantly by now due to global warming. The study used satellite data and historical records to compare sea ice conditions. It found that while there has been a slight decrease in the number of days with sea ice, the overall thickness and volume have remained stable. This suggests that the Arctic climate is not warming as rapidly as previously thought. The researchers also noted that the seasonal cycle of sea ice is still intact, with a clear melt in the summer and refreeze in the winter. This finding has important implications for understanding the impact of climate change on the Arctic region. It suggests that while there is still some warming, the Arctic sea ice is more resilient than expected. However, the study also points out that there are still uncertainties, particularly regarding the future of sea ice in a warmer world. Continued research is needed to better understand the complex interactions between the Arctic environment and global climate change.
